

The ELEM power utility company informs that the Spilje and Globocica hydro plants have, on Crn Drim river, have produced a total of 542 million kilowatt hours of electric energy in 2015, five percent over the projected production.

The plants are currently working under full capacity, given that abundant rains have helped fill their reservoirs.

The current levels of snow in the mountains along the Crn Drim river also ensures that the two significant producers will continue to meet their production quotas during 2016.
