

Imagine a world free of oil accidents, coal pollution and nuclear waste. A world where we wouldn't have to feel helpless in the face of climate change, because we did everything we could to prevent further warming. A world where energy was clean, safe and available for all.

That world is within our reach now.

The evidence is in: Renewable energy is viable, reliable, and ready to go - all that's needed for a clean energy revolution.

On this page we've grouped together some of the most common myths about renewable energy, explaining why they are just that - myths that don't stand up to reality.

But here's the thing, although we've busted the myths here, we need you to make the myth busting go beyond this page.

Please share it widely. Tweet, Facebook, and talk about it freely
